

# SPEEDY SHOES

## RADIO-CONTROLLED FROM YOUR POCKET

This is a special pair of shoes with a movable sole that makes you walking faster, up to 20 mph. The mechanism is activated by squeezing an handle kept in one hand and can be easily stopped by releasing the hold.

You can keep the controller in one pocket and assist your walk as desired. As you get in front of an obstacle or a traffic light, you can stop by releasing your hold. That's a instinctive reaction that makes deceleration and acceleration completely natural (fig. 3).

The movable part of the sole is slightly raised; battery and engine are not in your way and fit parts of the shoes that doesn't obstacle your walk. By splitting battery and engine, there isn't any bulky part that would spoil the design (see fig. 1 and 2).

Fig. 1

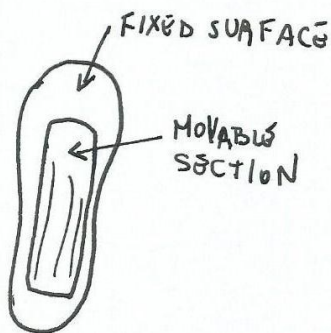

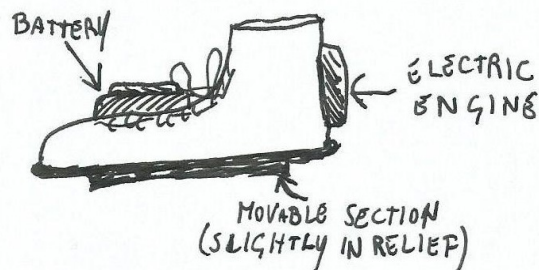

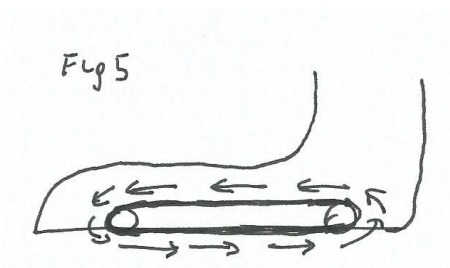

Fig. 2

A sliding belt is installed into the soil and powered by the engine:

The radio-controller can be kept in your hand without any strain, because of its ergonomic shape. You can accelerate by squeezing or decelerate by releasing the hold (see fig. 4)

When walking, we always touch the ground with at least one foot. This permits to maintain the same speed, adding 15 extra mph to the normal pace (in average 5 mph).

An other advantage is that you don't need to learn anything before wearing this pair of shoes. You don't have to maintain the equilibrium, like with the rollerblades and it's easy to stop. You can use the shoes wherever you want, in a mall, on the pavement or on the road. This will leave the people around you amazed, because they won't understand how you can walk so fast.
